#### Abstract

The dominant sequence transduction models are based on complex recurrent or convolutional neural networks that include an encoder and a decoder. The best performing models also connect the encoder and decoder through an attention mechanism. We propose a new simple network architecture, the Transformer, based solely on attention mechanisms, dispensing with recurrence and convolutions entirely. Experiments on two machine translation tasks show these models to be superior in quality while being more parallelizable and requiring significantly less time to train. Our model achieves 28.4 BLEU on the WMT 2014 English-to-German translation task, improving over the existing best results, including ensembles, by over 2 BLEU. On the WMT 2014 English-to-French translation task, our model establishes a new single-model state-of-the-art BLEU score of 41.8 after training for 3.5 days on eight GPUs, a small fraction of the training costs of the best models from the literature. We show that the Transformer generalizes well to other tasks by applying it successfully to English constituency parsing both with large and limited training data.

### Decoder

Fine Tuning (adaptation)

### **Generated code**

### Explanation

N

Can you write a Python program that transform strings like Nan Tang to N. Tang, and Ju Fan 🛛 🖉 to J. Fan

\$

Certainly! Here's a Python program that transforms strings in the format "First Name Last Name" to the format "Initial. Last Name":

```
Copy code
python
def transform_name(name):
   parts = name.split() # Split the name into first and last name
   if len(parts) != 2: # Ensure the name has two parts
        return name
   first_name, last_name = parts
   # Extract the initial of the first name
   first_initial = first_name[0] if first_name else ""
   # Construct the transformed name
   transformed_name = f"{first_initial}. {last_name}"
   return transformed_name
# Example usage
name1 = "Nan Tang"
name2 = "Ju Fan"
transformed_name1 = transform_name(name1)
transformed_name2 = transform_name(name2)
print(transformed_name1) # Output: N. Tang
print(transformed_name2) # Output: J. Fan
```

This program defines a function `transform\_name()` that takes a name as input, splits it into first and last names, and constructs the transformed name by taking the initial of the first name followed by a dot and the last name. If the input name does not have two parts (i.e., first and last name), it returns the original name as is. Finally, it demonstrates the usage of the function with example names.

#### Abstract

Entity resolution (ER) – which decides whether two data records refer to the same real-world object – is a long-standing data integration problem. The state-of-the-art results on ER are achieved by deep learning based methods, which typically convert each pair of records into a distributed representation, followed by using a binary classifier to decide whether these two records are a match or a non-match. However, these methods are dataset specific; that is, one deep learning based model needs to be trained or fine-tuned for each new dataset, which is not generalizable and thus we call them *specific ER models*. In this paper, we investigate *generic ER models*, which use a single model to serve multiple ER datasets over different datasets from various domains. In particular, we study two types of generic ER models: Employs foundation models (*e.g.*, GPT-3) or trains a generic ER model. Our results show that although GPT-3 can perform ER with zero-shot or few-shot learning, the performance is worse than specific ER models. Our trained generic ER model can achieve comparable performance with specific ER models, but with much less train data and much smaller storage overhead.

## Table Learning

### **Table Representation Learning workshop**

#### NeurIPS 2022, Room 398, Friday 2 December, New Orleans, USA

#### About

We develop large models to "understand" images, videos and natural language that fuel many intelligent applications from text completion to self-driving cars. But tabular data has long been overlooked despite its dominant presence in data-intensive systems. By learning latent representations from (semi-)structured tabular data, pretrained table models have shown preliminary but impressive performance for semantic parsing, question answering, table understanding, and data preparation. Considering that such tasks share fundamental properties inherent to tables, representation learning for tabular data is an important direction to explore further. These works also surfaced many open challenges such as finding effective data encodings, pretraining objectives and downstream tasks.

The Table Representation Learning workshop is the first workshop in this emerging research area and has the following main goals: 1) motivating tabular data as a first-class modality for representation learning and further shaping this area, 2) show-casing impactful applications of pretrained table models and discussing future opportunities thereof, and 3) facilitating discussion and collaboration across the machine learning, natural language processing, and data management communities.

**Q1: The passage P1** has the following content: Faraar (transl.Absconding) is a 1975 Bollywood crime film drama. The film is produced by Alankar Chitra and directed by Shanker Mukherjee. The film stars Amitabh Bachchan, Sharmila Tagore, Sanjeev Kumar, Sulochna, Sajjan, Agha and Bhagwan Dada...

The table T1 has the following columns: Year, Song, Film, Music Director, Lyricist.

**Based on P1 and T1**, the question is "Which songs appeared in a film produced by Alankar Chitra and directed by Shanker Mukherjee?".

What sub-questions can it be broken down into?

**GPT-3: Q1** What is the name of the film produced by Alankar Chitra and directed by Shanker Mukherjee. It can be answered by **P1**.

**Q2:** The first sub-question is "What is the name of the film produced by Alankar Chitra and directed by Shanker Mukherjee?", it can be answered by P1.

**GPT-3: Q2** the second sub-question is "What is the name of the song in the film?", it can be answered by **T1**.

#### Figure 3: A Running Example of Symphony.

## **PART I: Foundation Models: In-context Learning** for Data Preparation Single Tasks

- Early successes: entity matching, error detection, string transformation
- Limitations
- Research Opportunities
  - Table learning
  - Routing-based methods with modular architectures
  - Retrieval-based models

## **Retrieval-based Models**

### Improving language models by retrieving from trillions of tokens

Sebastian Borgeaud<sup>†</sup>, Arthur Mensch<sup>†</sup>, Jordan Hoffmann<sup>†</sup>, Trevor Cai, Eliza Rutherford, Katie Millican, George van den Driessche, Jean-Baptiste Lespiau, Bogdan Damoc, Aidan Clark, Diego de Las Casas, Aurelia Guy, Jacob Menick, Roman Ring, Tom Hennigan, Saffron Huang, Loren Maggiore, Chris Jones, Albin Cassirer, Andy Brock, Michela Paganini, Geoffrey Irving, Oriol Vinyals, Simon Osindero, Karen Simonyan, Jack W. Rae<sup>‡</sup>, Erich Elsen<sup>‡</sup> and Laurent Sifre<sup>†,‡</sup> All authors from DeepMind, <sup>†</sup>Equal contributions, <sup>‡</sup>Equal senior authorship

## **Retrieval-based Models**

## Non Retrieval-based Data Cleaning

### Input

health.csv							
	Name	Age	Gender	BT			
t1	John	54	NULL	А			
t2	Alice	36	F	NULL			
t3	Peter	38	М	AB			
t4	Calvin	17	NULL	0			
t5	Paul	73	М	NULL			

Spec

		Reasoner						
	+1	Name	Age	Gender	+ 1	Name	Age	Gender
1, t2, t4, t5		Name A	Age G	ender BT			.,	
7	t2	Alice	36	F NUL	L			
	t5	Name A	.ge Ge 36	ender BT	_			

Output

	Name	Age	Gender	BT
t1	John	54	М	
t2	Alice	36	F	В
t4	Calvin	17	М	
t5	Paul	73	М	Α

## Non Retrieval-based Data Cleaning

### Input

health.csv							
	Name	Age	Gender	BT			
t1	John	54	NULL	А			
t2	Alice	36	F	NULL			
t3	Peter	38	М	AB			
t4	Calvin	17	NULL	0			
t5	Paul	73	М	NULL			

Spec

	Not reliable
•	Sensitive data

	Reasoner							
	Name	Age G	ender	+1	Name	Age	Gender	
, t2, t4, t5	Name A	Age Genc	ler BT		Carvin	17	NOLL	
	t2 Alice 36 F NULL							
	Name A t5 Alice 3	ge Gend 36 F	er BT	-				
	ChatGPT							

# **Retrieval-based Data Cleaning**

**Tuple-based Cleaning** 

### Input

#### Not reliable - retrieved data Sensitive data - local models

### Output

	Name	Age	Gender	BT
t1	John	54	М	
t2	Alice	36	F	В
t4	Calvin	17	М	
t5	Paul	73	М	Α

## Conclusions

### Positioning

- Foundation models cannot replace humans for data preparation
- Treat/tune foundation models as your **thought partners**

### • Promising directions

- Adapting foundation models for specific tasks (discussed next)
- Enhancing foundation models with better reasoning (e.g., modularized design)
- Enhancing foundation models with better explainability (e.g., retrieval-based)
